Subject: FW: AZP Basin 1 sediments

Just letting you guys know what I observed yesterday. The sediments have been removed from Basin 1 and placed into two roll off containers. The basin was pressured washed to work the sediments down to a place where they could be removed via vac truck. Composited grab samples will be taken of the sediments and a tcip run for the RCRA 8 metals and zinc. Per our request on 6/10 samples were taken of the released spent solution and sent to Pace. We have not gotten those results yet.

Since being cleaned out, the basin has begun to fill with rain water and there still is significant capacity to receive more storm water before having to discharge. According to AZP staff the pH coming into the basin continues to be around 5.5 which seems to indicate the presence of something other than storm water still in the SW collection system. I conveyed these concerns to DEMLR on a call this morning and we are planning a meeting with them and DWR to discuss this release further, hopefully by then we will have some more data to characterize the release.

Thanks,
Jeff
